

**AMENDMENTS TO CLAIMS**

1. (Original) A method for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$  and a key  $K$ , the method comprising:

receiving  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0;

setting  $Q_0$  equal to an initial value; and

for each plaintext block of the  $n$  plaintext blocks:

computing  $Q_i = E_K(Q_{i-1}) \text{ XOR } P_i$ ; and

computing  $C_i = M(P_i, Q_i)$ ,

thereby producing  $n$  ciphertext blocks,

wherein:

$0 < i \leq n$ , and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$ ,

selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second

argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

2. (Original) The method according to claim 1 and wherein  $M$  is chosen in accordance with a standard indicating bits that are not to be encrypted.

3. (Original) The method according to claim 2 and wherein the standard comprises one of the following: an audio standard; a video standard; and an audio-video standard.

4. (Original) The method according to claim 3 and wherein the standard comprises MPEG-2.

5. (Original) A method for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$  and a key  $K$ , the method comprising:

receiving  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0, and an initial value  $IV$ ;

computing  $IV' = M(P_1, IV)$ ;

computing  $Q_0 = H(IV')$ ; and

for each plaintext block of the  $n$  plaintext blocks:

computing  $Q_i = E_K(Q_{i-1}) \text{ XOR } P_i$ ; and

computing  $C_i = M(P_i, Q_i)$ ,

thereby producing  $n$  ciphertext blocks,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$

selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second

argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

6. (Original) The method according to claim 5 and wherein  $H$  comprises SHA1.

7. (Original) The method according to claim 5 and wherein  $H(IV')$  comprises  $E_K(IV') \text{ XOR } IV'$ .

8. (Currently Amended) The method according to ~~any of claims 5-7~~ claim 5 and wherein  $M$  is chosen in accordance with a standard indicating bits that are not to be encrypted.

9. (Original) The method according to claim 8 and wherein the standard comprises one of the following: an audio standard; a video standard; and an audio-video standard.

10. (Original) The method according to claim 9 and wherein the standard comprises MPEG-2.

11. (Original) In a method for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$  and a key  $K$  in a stream mode, wherein  $P_i$  denotes an  $i$ -th plaintext block, and  $C_i$  denotes an  $i$ -th ciphertext block, an improvement comprising:

for each bit  $C_{ij}$  of block  $C_i$ , selecting  $P_{ij}$  as an output if bit  $P_{ij}$  is not to be encrypted.

12. (Original) The method according to claim 11 and wherein the stream mode comprises CFM mode.

13. (Original) Apparatus for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$  and a key  $K$ , the at least one plaintext block comprising  $n$  plaintext blocks, the at least one ciphertext block comprising  $n$  ciphertext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

an initialization unit for setting  $Q_0$  equal to an initial value; and

a computation unit operative, for each plaintext block of the n plaintext blocks:

to compute  $Q_i = E_K(Q_{i-1}) \text{ XOR } P_i$ ; and

to compute  $C_i = M(P_i, Q_i)$ ,

wherein:

$0 < i \leq n$ , and

$P_i$  denotes an i - th plaintext block of the n plaintext blocks, and

$C_i$  denotes an i - th ciphertext block of the n ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$  selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

14. (Original) Apparatus for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$ , a key  $K$ , and an initial value  $IV$ , the at least one plaintext block comprising n plaintext blocks, the at least one ciphertext block comprising n ciphertext blocks, wherein n is an integer greater than 0, the apparatus comprising:

a first computation unit for computing  $IV' = M(P_1, IV)$ ;

a second computation unit for computing  $Q_0 = H(IV')$ ; and

a third computation unit operative, for each plaintext block of the n plaintext blocks:

to compute  $Q_i = E_K(Q_{i-1}) \text{ XOR } P_i$ ; and

to compute  $C_i = M(P_i, Q_i)$ ,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and  
 $C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and  
 $M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$   
selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second  
argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

15. (Original) In apparatus for producing at least one ciphertext  
block from at least one plaintext block using a block cipher  $E$  and a key  $K$  in a  
stream mode, wherein  $P_i$  denotes an  $i$  - th plaintext block, and  $C_i$  denotes an  $i$  -  
th ciphertext block, an improvement comprising:

a selector unit operative, for each bit  $C_{ij}$  of block  $C_i$ , to select  $P_{ij}$   
as an output if bit  $P_{ij}$  is not to be encrypted.

16. (Original) A method for producing at least one plaintext block  
from at least one ciphertext block encrypted using a block cipher  $E$  and a key  $K$ ,  
the method comprising:

receiving  $n$  ciphertext blocks, where  $n$  is an integer greater than 0;

setting  $Q_0$  equal to an initial value; and

for each ciphertext block of the  $n$  ciphertext blocks:

computing  $Q'_i = E_K(Q_{i-1}) \text{ XOR } C_i$ ;

computing  $P_i = M(C_i, Q'_i)$ ; and

computing  $Q_i = M(Q'_i, C_i)$ ,

thereby producing  $n$  plaintext blocks,

wherein:

$0 < i \leq n$ , and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and  
 $C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and  
 $M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$   
selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second  
argument of  $M$  if bit  $P_{ij}$  is encrypted.

17. (Original) The method according to claim 16 and wherein  $M$  is  
chosen in accordance with a standard indicating bits that are not encrypted.

18. (Original) The method according to claim 17 and wherein the  
standard comprises one of the following: an audio standard; a video standard; and  
an audio-video standard.

19. (Original) The method according to claim 18 and wherein the  
standard comprises MPEG-2.

20. (Original) A method for producing at least one plaintext block  
from at least one ciphertext block using a block cipher  $E$  and a key  $K$ , the method  
comprising:

receiving  $n$  ciphertext blocks, wherein  $n$  is an integer greater than 0,  
and an initial value  $IV$ ;

computing  $IV' = M(P_1, IV)$ ;

computing  $Q_0 = H(IV')$ ; and

for each ciphertext block of the  $n$  ciphertext blocks:

computing  $Q'_i = E_K(Q_{i-1}) XOR C_i$ ;

computing  $P_i = M(C_i, Q'_i)$ ; and

computing  $Q_i = M(Q'_i, C_i)$ ,

thereby producing n plaintext blocks,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$

selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is encrypted.

21. (Original) The method according to claim 20 and wherein  $H$  comprises SHA1.

22. (Original) The method according to claim 20 and wherein  $H(IV')$  comprises  $E_K(IV') \text{ XOR } IV'$ .

23. (Currently Amended) The method according to ~~any of claims 20-22~~ claim 20 and wherein  $M$  is chosen in accordance with a standard indicating bits that are not encrypted.

24. (Original) The method according to claim 23 and wherein the standard comprises one of the following: an audio standard; a video standard; and an audio-video standard.

25. (Original) The method according to claim 24 and wherein the standard comprises MPEG-2.

26. (Original) In a method for producing at least one plaintext block from at least one ciphertext block using a block cipher  $E$  and a key  $K$  in a stream mode, wherein  $P_i$  denotes an  $i$  - th plaintext block of the plurality of plaintext blocks, and  $C_i$  denotes an  $i$  - th ciphertext block of the plurality of ciphertext blocks, an improvement comprising:

for each bit  $P_{ij}$  of block  $P_i$ , selecting  $C_{ij}$  as an output if bit  $C_{ij}$  is not encrypted.

27. (Original) The method according to claim 26 and wherein the stream mode comprises CFM mode.

28. (Original) Apparatus for producing at least one plaintext block from at least one ciphertext block encrypted using a block cipher  $E$  and a key  $K$ , the at least one ciphertext block comprising  $n$  ciphertext blocks, the at least one plaintext block comprising  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

initialization apparatus for setting  $Q_0$  equal to an initial value; and  
a computation unit operative, for each ciphertext block of the  $n$  ciphertext blocks:

to compute  $Q'_i = E_K(Q_{i-1}) \text{ XOR } C_i$ ;

to compute  $P_i = M(C_i, Q'_i)$ ; and

to compute  $Q_i = M(Q'_i, C_i)$ ,

wherein:

$0 < i \leq n$ , and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$  selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is encrypted.

29. (Original) Apparatus for producing at least one plaintext block from at least one ciphertext block using a block cipher  $E$  and a key  $K$ , the at least one ciphertext block comprising  $n$  ciphertext blocks, the at least one plaintext block comprising  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

a first computation unit for computing  $IV' = M(P_1, IV)$ ;

a second computation unit for computing  $Q_0 = H(IV')$ ; and

a third computation unit operative, for each ciphertext block of the  $n$  ciphertext blocks:

to compute  $Q'_i = E_K(Q_{i-1}) XOR C_i$

to compute  $P_i = M(C_i, Q'_i)$ ; and

to compute  $Q_i = M(Q'_i, C_i)$ ,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$  selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is encrypted.

30. (Original) In apparatus for producing at least one plaintext block from at least one ciphertext block using a block cipher  $E$  and a key  $K$  in a stream mode, wherein  $P_i$  denotes an  $i$  - th plaintext block of the plurality of plaintext blocks, and  $C_i$  denotes an  $i$  - th ciphertext block of the plurality of ciphertext blocks, an improvement comprising:

a selector unit operative, for each bit  $P_{ij}$  of block  $P_i$ , to select  $C_{ij}$  as an output if bit  $C_{ij}$  is not encrypted.

31. (New) A system for scrambling/descrambling packets, comprising a scrambling/descrambling device to scramble/descramble the packets based on an Initial Value and a Key, each of the packets having a must stay clear (MSC) section which must always stay in the clear, the Initial Value for each of the packets being a function of at least part of the MSC section of an associated one of the packets being processed.

32. (New) The system according to claim 31, wherein the MSC section includes an adaptation field, the Initial Value being a function of at least part of the adaptation field of the one packet being processed.

33. (New) The system according to claim 32, wherein the Initial Value is a function of the data content of the adaptation field of the one packet being processed.

34. (New) A method for scrambling/descrambling packets, each of the packets having a must stay clear (MSC) section which must always stay in the clear, the method comprising:

determining an Initial Value for each of the packets as a function of at least part of the MSC section of an associated one of the packets being processed; and

scrambling/descrambling the packets based on the Initial Value and a Key.

35. (New) The method according to claim 34, wherein the MSC section includes an adaptation field, the determining including determining the Initial Value as a function of at least part of the adaptation field of the one packet being processed.

36. (New) The method according to claim 35, wherein the determining includes determining the Initial Value as a function of the data content of the adaptation field of the one packet being processed.

37. (New) Apparatus for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$  and a key  $K$ , the at least one plaintext block comprising  $n$  plaintext blocks, the at least one ciphertext block comprising  $n$  ciphertext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

means for setting  $Q_0$  equal to an initial value; and

means for computing:

$$Q_i = E_K(Q_{i-1}) \text{ XOR } P_i; \text{ and}$$

$C_i = M(P_i, Q_i)$ , for each plaintext block of the  $n$  plaintext blocks,

wherein:

$$0 < i \leq n, \text{ and}$$

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$  selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

38. (New) Apparatus for producing at least one ciphertext block from at least one plaintext block using a block cipher  $E$ , a key  $K$ , and an initial value  $IV$ , the at least one plaintext block comprising  $n$  plaintext blocks, the at least one ciphertext block comprising  $n$  ciphertext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

means for computing  $IV' = M(P_1, IV)$ ;

means for computing  $Q_0 = H(IV')$ ; and

means for computing:

$Q_i = E_K(Q_{i-1}) \text{ XOR } P_i$ ; and

$C_i = M(P_i, Q_i)$ , for each plaintext block of the  $n$  plaintext blocks,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$  selects a first argument of  $M$  if bit  $P_{ij}$  is not to be encrypted, and selects a second argument of  $M$  if bit  $P_{ij}$  is to be encrypted.

39. (New) Apparatus for producing at least one plaintext block from at least one ciphertext block encrypted using a block cipher  $E$  and a key  $K$ , the at least one ciphertext block comprising  $n$  ciphertext blocks, the at least one plaintext block comprising  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

means for setting  $Q_0$  equal to an initial value; and

means for computing:

$$Q'_i = E_K(Q_{i-1}) \text{ XOR } C_i;$$

$$P_i = M(C_i, Q'_i); \text{ and}$$

$$Q_i = M(Q'_i, C_i), \text{ for each ciphertext block of the } n$$

ciphertext blocks,

wherein:

$0 < i \leq n$ , and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$ ,

selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second

argument of  $M$  if bit  $P_{ij}$  is encrypted.

40. (New) Apparatus for producing at least one plaintext block from at least one ciphertext block using a block cipher  $E$  and a key  $K$ , the at least one ciphertext block comprising  $n$  ciphertext blocks, the at least one plaintext block comprising  $n$  plaintext blocks, wherein  $n$  is an integer greater than 0, the apparatus comprising:

means for computing  $IV' = M(P_1, IV)$ ;

means for computing  $Q_0 = H(IV')$ ; and

means for computing:

$$Q'_i = E_K(Q_{i-1}) \text{ XOR } C_i;$$

$$P_i = M(C_i, Q'_i); \text{ and}$$

$$Q_i = M(Q'_i, C_i), \text{ for each ciphertext block of the n}$$

ciphertext blocks,

wherein:

$0 < i \leq n$ , and

$H$  is a hash function, and

$P_i$  denotes an  $i$  - th plaintext block of the  $n$  plaintext blocks, and

$C_i$  denotes an  $i$  - th ciphertext block of the  $n$  ciphertext blocks, and

$M$  is a selector function which, for each bit  $C_{ij}$  of block  $C_i$ ,

selects a first argument of  $M$  if bit  $P_{ij}$  is not encrypted, and selects a second

argument of  $M$  if bit  $P_{ij}$  is encrypted.
